Is this the End of High Paying Tech Jobs?

This field is a disaster now, but there is something...

Stress + LayOff + AI + Trumps decisions

There was a time when people considered computer scientists and software developers as GODS!

They were raking in money, companies were scrambling to hire, and startups were getting funded left and right.

But things have changed now.

Big tech companies like Google, Amazon, Microsoft, and IBM are cutting costs aggressively.
Even IBM is planning to lay off thousands in the US while setting up offshore teams in India.

The software development market over the last 2–3 years is nothing like it was before. During the 2020s, especially during the pandemic, hiring was at an all-time high. Cracking a FAANG job was way easier. But today? You will struggle and need to put in way more work.

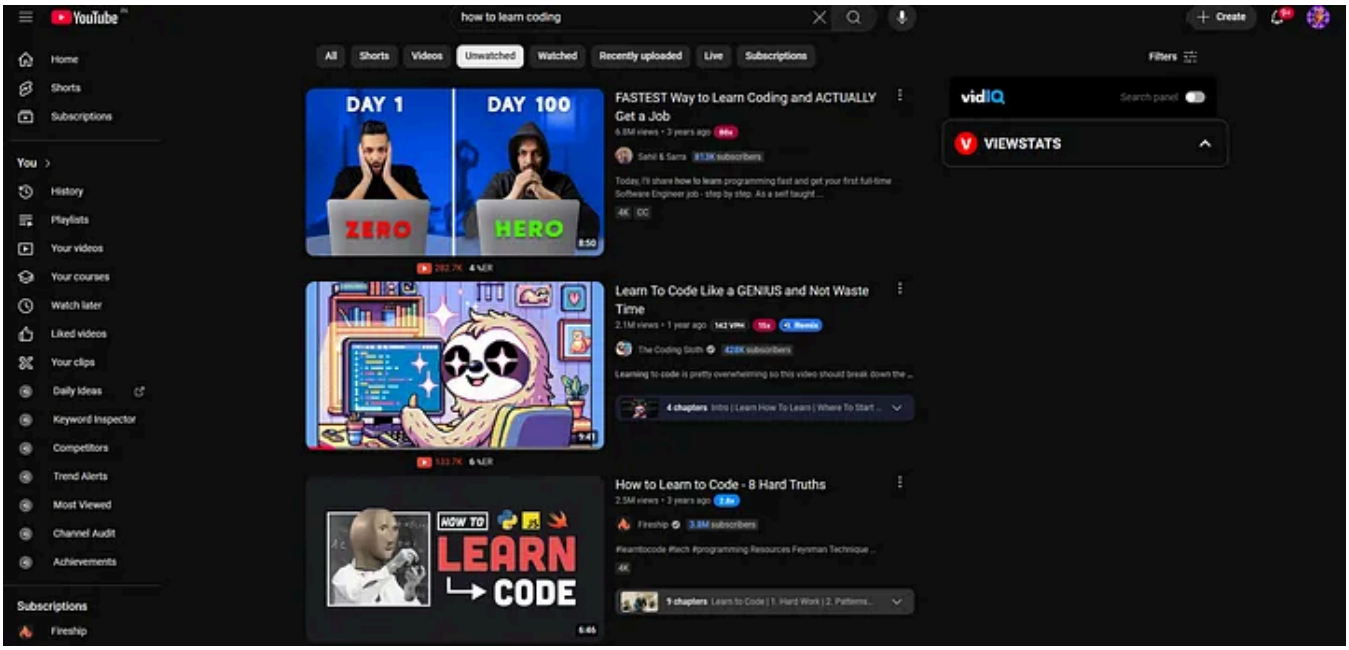

I'm thankfully not impacted by many of the mass layoffs, but I have seen a clear decline in demand for IT professionals in service-based as well as product-based companies.

Over-Saturated Market

The market is oversaturated.

Thanks to TikTok and YouTube influencers who flooded the internet with “Day in the Life of a Software Engineer” videos, the industry became over-glamorized.

Fancy work-from-home setups, free office food, and six-figure salaries made it seem like the ultimate dream job.

And with the ease of getting started — just open YouTube and start coding — a flood of junior devs entered the market.

Many of those who started during the pandemic have now secured mid-to-senior roles, making it even harder for new developers to break in.

One of the most important lessons companies learned from COVID-19 was that they could offshore work at a fraction of the cost. Today, most companies are overstaffed.

Although most companies are overstaffed.

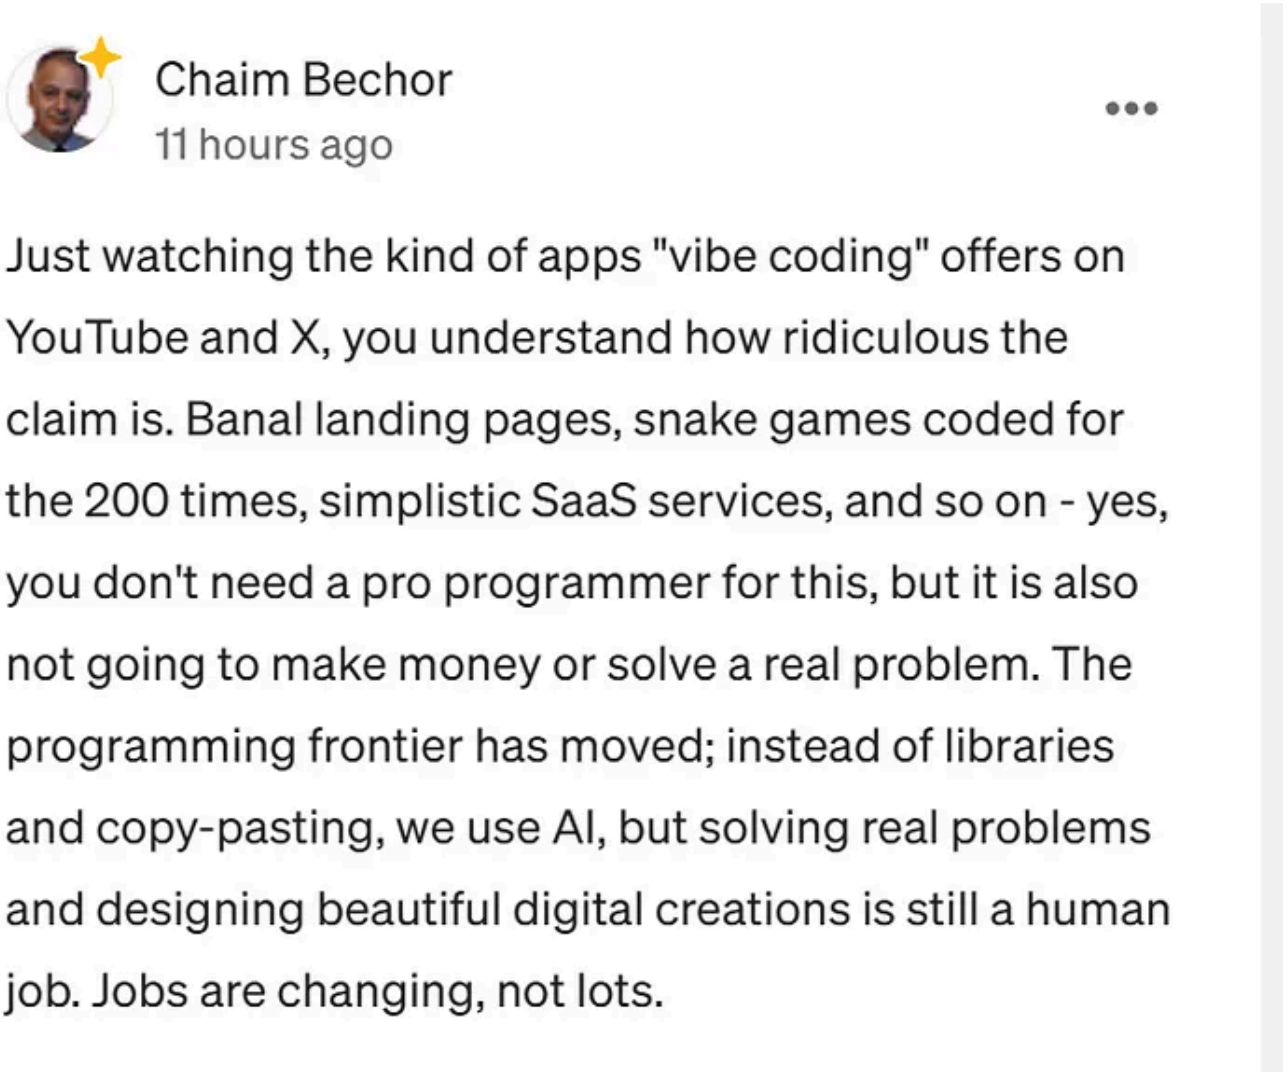

Source

Elon Musk set the tone by laying off more than 6,000 workers from Twitter (now X), and other companies followed.

Now, with AI taking over many coding tasks, people are scared, wondering, “What if I’m next?”

But interestingly, I made a post last day and got a bunch of replies from great developers out there.

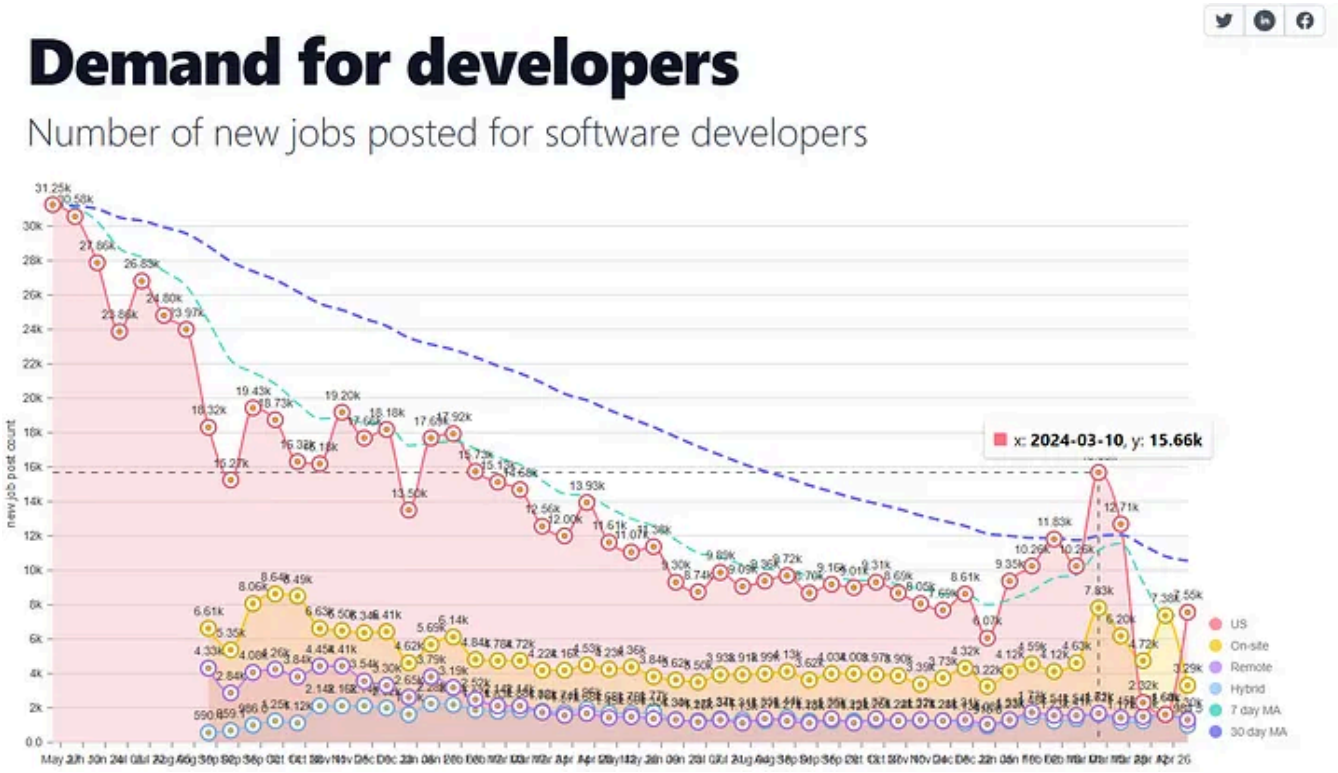

Screenshot

The above comment by Bechor is so true. AI is not replacing developers — it is redefining what it means to be one. Simple coding tasks may become obsolete (it already is), but there will always be a demand for those who can solve complex problems and innovate.

Creating landing pages or basic logic is great for hackathons, but in the real world, we deal with code that manages billions of dollars, powers banking systems, and even launches satellites.
AI isn't at a stage where it can fully replace human problem-solving and critical thinking.

But yeah, if you are so dependent on AI and you act like you don't have a brain and ChatGPT is your brain, you are cooked. You are way better than LLM; don't lose it.

But it's true that the supply of developers far exceeds the demand. You can check the latest employment data to see the decline.

sourcea

I will also give a rough number.

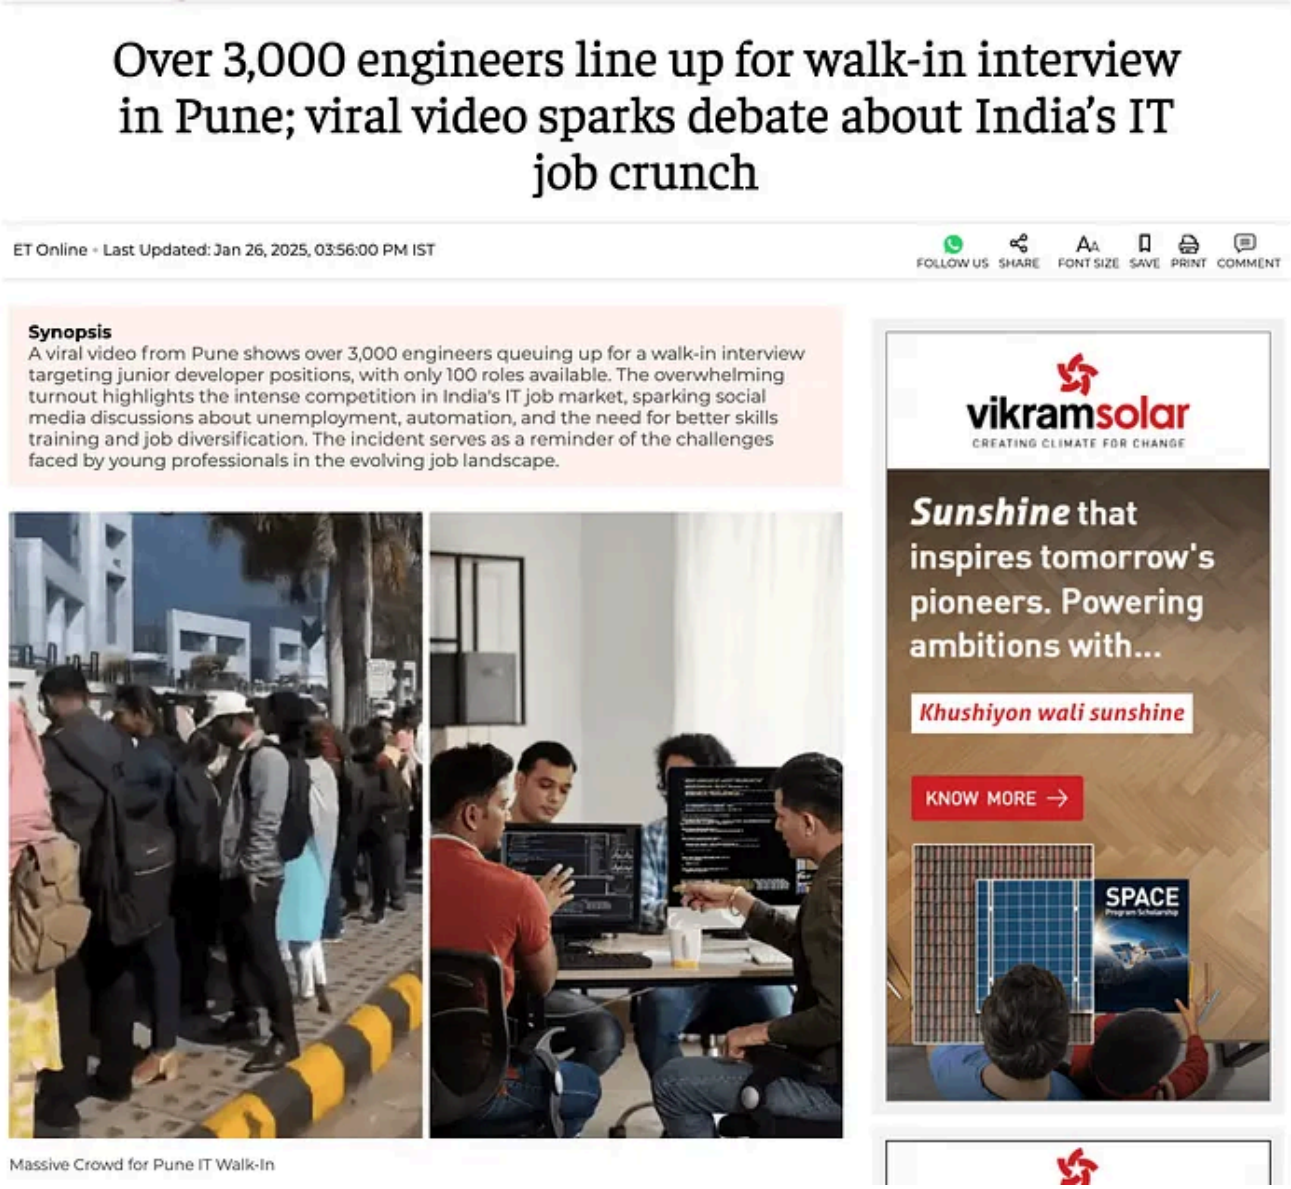

In a country like India, more than 300,000 computer science graduates enter the job market every year. But can India or Indian companies absorb 300,000 new employees annually?

Absolutely not.

At most, 50K–80K get decent jobs, and even then, 80% of them are paid peanuts compared to global standards.

I've even seen thousands of applicants lining up for just a handful of positions — sometimes 3,000+ people for 4–5 job openings.

That's the brutal reality of the job market right now.

Screenshot

But you will say something like:

> Another day, another fearmonger

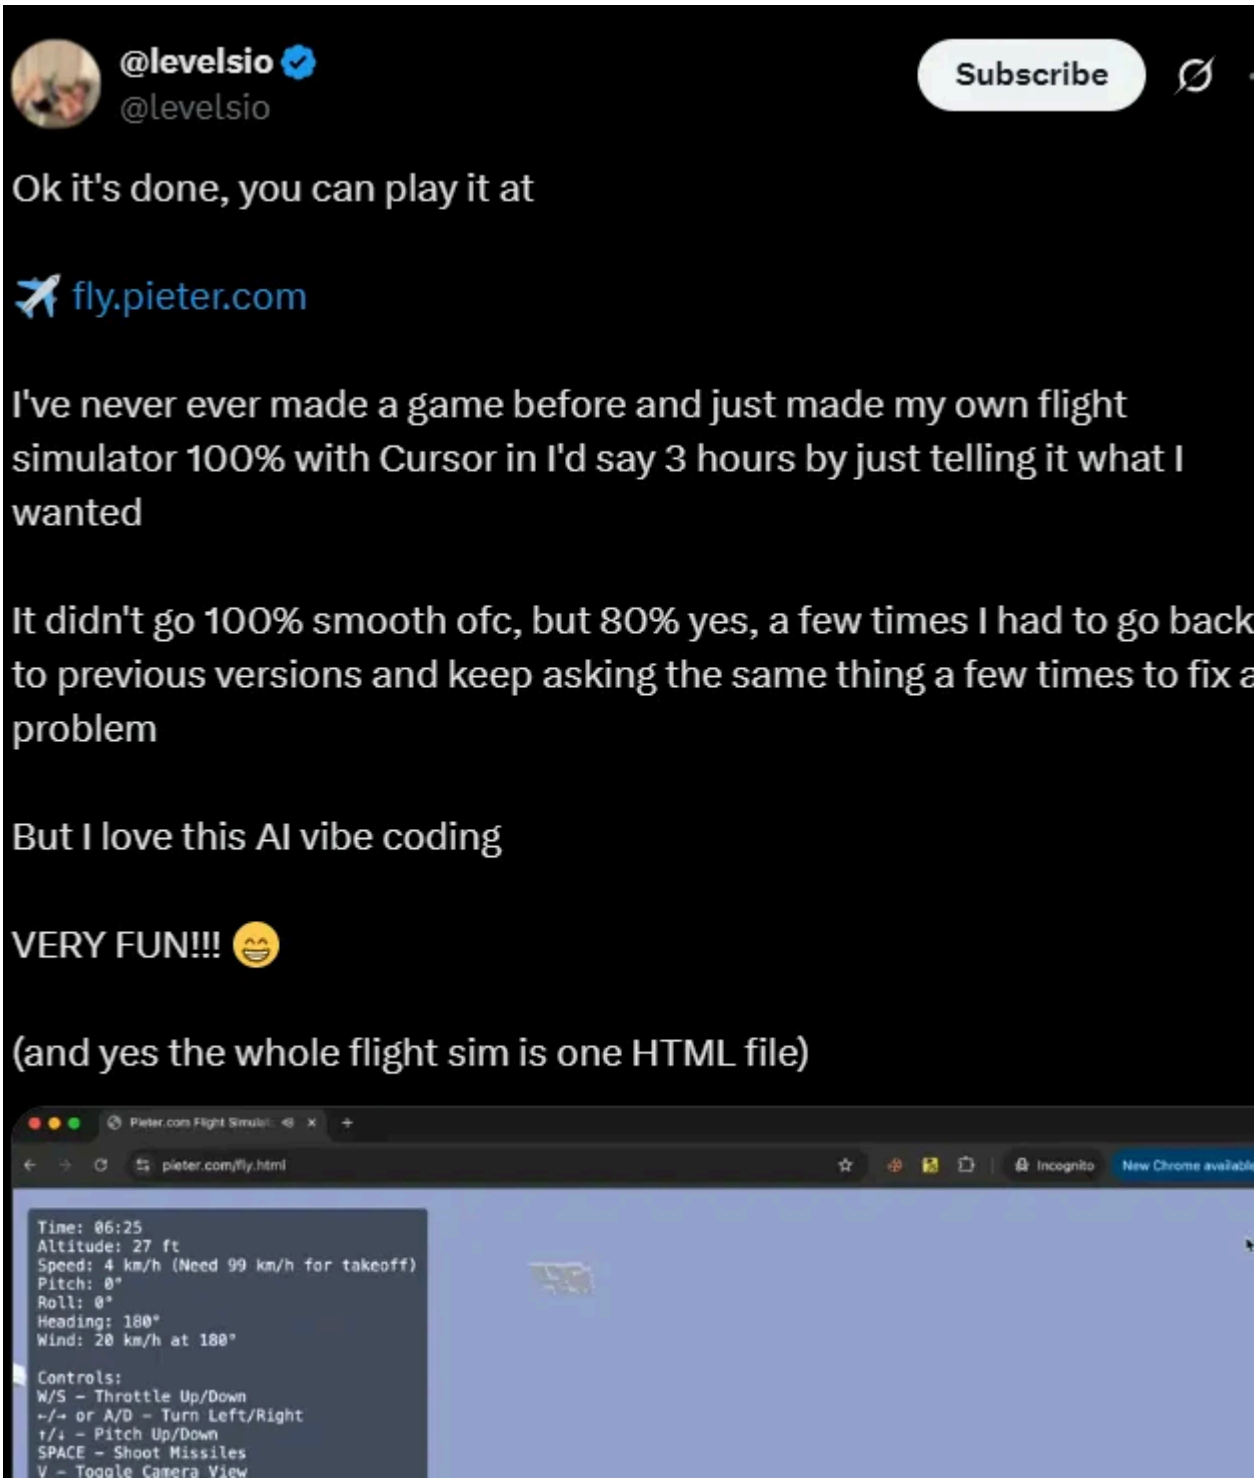

But let me tell you something. This is still the best time to be alive. There are enough opportunities out there. It all comes down to mindset.

There are two kinds of developers:

1. **Scarcity Mindset Developers** — They believe everything is over, the world is collapsing, and they live in fear.
2. **Abundance Mindset Developers** — These people adapt, evolve, and climb the ladder no matter what.

People like levels.io are a perfect example. They spot trends before they blow up and capitalize on them.

They aren't stuck complaining about job losses — they are out there building, innovating, and making money while others panic.

You need to use your critical thinking ability to find out the next favourite spot on the internet.

Even the best algorithms take time to find the latest trend, but you can catch it way earlier because, you know, your brain is 1000X more powerful than an LLM if you use it wisely.

Copy-pasting from Stack Overflow won't cut it anymore.

Tech jobs aren't disappearing; they are transforming

If you're still waiting for companies to hand out jobs like they did in 2020, you're already behind.

Technology Money AI Tech Business
